
Generating Investment Returns

Nov 07 2022

During our ongoing weekly discussions with clients, we occasionally get questions from individuals about their approach to investing – particularly in terms of fees and value.

The questions are usually focused on the cost of accessing investment advice, or the cost of buying specific investment vehicles such as mutual funds, ETFs etc. With the rise of fintech, trading platforms for smartphones and so on, we also hear questions about the technology related to buying, selling, and monitoring investments.

The "trap" with "new" technology is the lack of clear focus on the process of constructing and monitoring a complete portfolio (RRSP, TFSA, Open investments) as opposed to just monitoring individual holdings. To paraphrase an old saying: "the whole is greater than the parts".

The concern is that, in a decade from now, new investors may have paid low or no fees but actually achieved very poor returns. This is not a prediction but an observation on the study of behavioral economics and experience.

The other concern is that a generation of younger investors may avoid owning equity investments because they focused on short term events (volatility & market corrections) rather than on long term realities - the growth potential of the overall economy over time.

Let us first define "investing". This is simply the purchase of an ownership interest in a public company (via a mutual fund or segregated fund) which entitles investors to share in profits generated on an annual basis. Professional investment managers spend all their time researching and selecting the right companies with the best long-term prospects for growth - at rates above inflation and interest rates.

This is what Warren Buffett refers to when he says: *"In the long run the stock market is a counting machine (of your growing wealth) but in the short term the stock market is a voting machine (driven by investor emotions)."*

The opposite of "Investing" is "Trading" which is any system based on price movement or momentum. Inexperienced investors often buy investments near a "top" when something looks like a "sure thing" - after it has already risen dramatically. One only need to examine the money flows into technology oriented mutual funds in late 1999 – only a few months before Nasdaq famously crashed!

The real question investors should ask is "how to generate investment returns?" You cannot buy an 8% compounded return. Investment returns are a by-product of process. Which means the method of creating and maintaining a portfolio is VERY important to the outcomes.

For example, a "quality" car is the result of a company making many little adjustments and tweaks that improve quality over previous efforts to build that same car.

There are various approaches to selecting investments and creating a portfolio. You can use a growth, value, or momentum or some combination of these investment styles. These styles always involve assessing potential profits over time and making decisions based on this data.

There is also the option of adding in various analysis screens (top-down macro, contrarian, etc.) to the mix.

The key to long term financial success is that, whatever portfolio management strategy you apply, you are consistent over time. Investment returns happen over time and over numerous business cycles. "Trading" based primarily on short term trends seldom produces long term financial gains! Patience is your friend.

In summary:

1. What disciplined investment process are you using?
2. Are you an investor or a trader?
